

DIGITAL ASSET CARE USE CASE:

Digitise Asset Care Management.

CHALLENGE

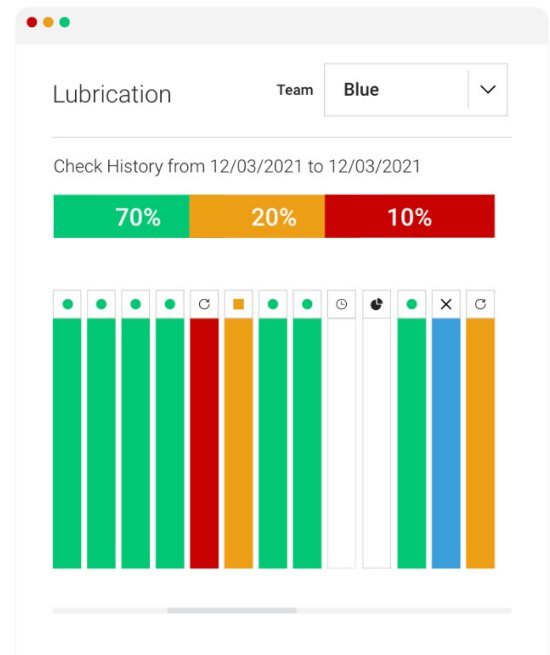

From cleaning and lubrication to inspections, track and manage the details of your equipment assets.

- Still reliant on paper-based check sheets
- SOPs to complete the checks are not easily available
- Manual collation and cross-check of tasks is completed retrospectively
- Flagged issues to be investigated are only identified when sheets are reviewed
- Have to manually input the data into a system to generate the KPIs
- Check sheets are not easy to reference when further investigation is required

SOLUTION

Keep on top of your asset care tasks.

DigiView allows you to digitise asset care and inspections. Records can be organised based on frequency and grouped per asset or area. If maintenance activities are scheduled, the appropriate team will be notified when the task is due to be completed. Overdue tasks are flagged automatically and with an optional reminder prompt. All guides, SOPs and instructional videos can be accessed directly from the system to ensure that the tasks are completed as per the required standard.

Identify non-compliance and maintenance issues immediately.

Any checks that require further investigation can be highlighted immediately and comments added. Also, parameters and tolerance bands for the checks can be added and if the check is outside these limits, they will be flagged so teams can focus efforts on items that require attention. The KPIs for the completion rate of the checks are automatically generated for reporting purposes.

RESULTS

Traceable logs for cleaning, lubrication & inspection

Reduce manager time investigating issues

Eliminate paper equipment logs

Spot trends, drift & recurring issues faster
